

# Assignment 4: Web Service Implementation

## PRD & AI-Assisted Development Report

PromptCrafter - AI Prompt Builder

June 2, 2026

## Part 1: Product Requirements Document

### 1. Product Overview

PromptCrafter is an AI-assisted web service designed to help users generate highly optimized, professional-grade prompts for Large Language Models like ChatGPT, Claude, and Gemini. It solves the blank canvas problem by providing a structured, intuitive interface where users can select frameworks, roles, and magic keywords without needing to memorize prompt engineering techniques.

### 2. Target Users

- Students & Academics: Needs help structuring essays, summarizing papers, or planning study schedules.
- Developers: Needs help debugging code, writing documentation, or understanding new frameworks.
- Marketers & Creators: Needs engaging copy, content strategies, and SEO optimization.
- General Public: People who want to use AI effectively but don't know how to write good prompts.

Pain Points Addressed: Low quality AI responses due to vague instructions, lack of knowledge about prompt engineering, and the repetitive nature of typing out constraints.

### 3. Project Goals

- Provide a 1-minute, zero-learning-curve prompt generation experience.
- Implement at least 4 proven prompt frameworks.
- Ensure the output is instantly usable via a 1-click copy feature.
- Maintain a visually pleasing, modern glassmorphism UI.

### 4. Core User Scenario

1. A user wants to write a marketing email but doesn't know how to instruct the AI.
2. The user opens PromptCrafter.
3. They select the Deep Persona framework and choose the Digital Marketer role.
4. They enter their task: Write a launch email for a new productivity app.
5. They open Advanced Options and check the Virtual Tip and Reverse Questioning magic keywords.
6. A perfectly structured markdown prompt is dynamically generated.
7. The user clicks Copy and pastes it into ChatGPT.
8. The user clicks Save to Library to reuse this setup later.

## 5. Feature List

- Framework Selection: Dropdown to select different prompt engineering structures.
- Dynamic Prompt Generator: Real-time text generation based on inputs.
- Advanced Options: Inputs for Context, Target Audience, and Constraints.
- Prompt Boosters: Checkboxes to inject proven prompt hacks.
- Clipboard Copy: 1-click copy functionality.
- My Library: Save and delete favorite prompts using Local Storage.

## 6. Page Structure

The application is a Single Page Application divided into three logical sections:

1. Home Section: Landing area with a hero title, brief description, and a Start button.
2. Builder Section: The core tool area containing dropdowns, inputs, advanced options toggle, and the real-time result preview.
3. Library Section: A dashboard grid displaying previously saved prompts.

## 7. Technical Requirements

- Frontend: HTML5, Vanilla CSS3, Vanilla JavaScript. No frontend frameworks are used to keep it lightweight.
- Styling: CSS variables for theming, CSS Flexbox/Grid for layout, and backdrop-filter for glassmorphism.
- Storage: Browser localStorage API for the Library feature.
- Deployment: Vercel.

## 8. Design Requirements

- Theme: Dark Mode by default.
- Aesthetics: Glassmorphism - semi-transparent panels with background blur over floating, animated gradient orbs.
- Typography: Outfit Google Font for a modern, geometric, and clean look.
- Interactions: Smooth CSS transitions for button hovers, section toggling, and expanding the advanced options panel.

## 9. Milestones

1. Idea Definition & PRD Completion: Outline the problem, solution, and core features.
2. First Prototype: Implement the basic HTML/CSS skeleton and simple string-concatenation JS logic.
3. Advanced Implementation: Integrate prompt frameworks and magic keywords based on prompt engineering research.
4. Refinement & Testing: Add smooth UI transitions and test Local Storage persistence.
5. Final Deployment: Push code to GitHub and deploy publicly via Vercel.

## Part 2: AI-Assisted Development Report

### 1. AI Tools Used

- Gemini 3.1 Pro (via Antigravity IDE)

### 2. Tasks Assisted by AI

- PRD Writing: The core idea for a prompt generator was developed independently. The AI was subsequently utilized to structure the concepts into a professional Product Requirements Document (PRD) meeting the assignment guidelines.
- UI/UX Design & Publishing: The AI was instructed to assist in writing the HTML skeleton and applying modern CSS styling, including glassmorphism, dark mode, and background animations.
- JavaScript Implementation: The AI was utilized to help implement the core logic, such as real-time prompt assembly, clipboard copying, and saving data using the browser Local Storage.
- Prompt Engineering Logic: Prompt engineering techniques (such as Chain of Thought and reverse questioning) were researched, and the AI was instructed to implement these dynamic frameworks and magic keyword checkboxes.

### 3. Representative Prompts Used

1. A custom AI prompt generator is proposed. Draft a professional PRD that includes the Product Overview, Target Users, and Feature List.
2. Based on the drafted PRD, generate the index.html, style.css, and script.js files. Ensure the design utilizes a modern glassmorphism aesthetic and a dark theme.
3. Based on prompt hacking techniques such as promising a tip and asking for reverse questions found in a research article, incorporate these as magic keyword checkboxes in the web application.

### 4. Modifications and Improvements

- Natural Prompt Generation: The initial string concatenation method suggested by the AI was too basic. The engine was completely overhauled to utilize a switch-case statement that handles 4 distinct frameworks (Basic, Chain of Thought, Persona, Extraction) and outputs structured markdown.
- Prompt Boosters: Based on independent research, logic and UI for toggleable advanced options were added. These magic keywords (e.g., promising a virtual tip, inducing reverse questions) are automatically appended to the bottom of the prompt when checked, significantly improving the output quality.
- Design Details: The initial background gradient animation was too fast and distracting. The CSS animation duration was adjusted to 10 seconds to create a much smoother and less intrusive visual experience, and smooth dropdown animations were added to the advanced options panel.

### 5. Bugs, Errors, and Limitations Found

- Issue: When opening the browser to use the library (Local Storage) feature for the first time, the application threw a JavaScript error because the stored data was null, which broke the array forEach method.

- Solution: This was resolved by adding a logical OR operator when parsing the JSON data. If the data is empty or null, it now returns an empty array as the default value, successfully eliminating the error.

## 6. Final Vercel Deployment URL

- <https://promptcrafter-six.vercel.app>
